- 1 Read Dust Count Data
- 2 Read TDS, SVM and CNN fit data (with eq. from Zaslavsky et al. (2021))
- 3 Read the RPW-TDS duty cycle data if correct mode is used (non nans)
- 4 Convert from daily dust count to dust impact rates using duty cycle values
- 5 Mark days at aphelion and perihelion
- 6 Plot the dust impact rates and the fit to the data

This script calculates the TDS, SVM and CNN dust impact rates

1 - Read Dust Count Data

```
TDS_data = readtable('TDS_ddc.txt');
SVM_data = readtable('SVM_ddc.txt');
CNN_data = readtable('CNN_ddc.txt');

TDS_ddc = TDS_data.daily_dust_count;
SVM_ddc = SVM_data.daily_dust_count;
CNN_ddc = CNN_data.daily_dust_count;
```

2 - Read TDS, SVM and CNN fit data (with eq. from Zaslavsky et al. (2021))

```
fit_data = readtable('fits');
dcycle = fit_data.dutyCycle_day_;
TDS_fit = fit_data.tds_fit__day_;
SVM_fit = fit_data.svm_fit__day_;
CNN_fit = fit_data.cnn_fit__day_;
% Read time data and convert ti datetime format
fit_years = fit_data.year;
fit_months = fit_data.month;
fit_days = fit_data.day;
days_plot = datetime(fit_years,fit_months,fit_days);
```

Warning: Column headers from the file were modified to make them valid MATLAB identifiers before creating variable names for the table. The original column headers are saved in the VariableDescriptions property.

Set 'VariableNamingRule' to 'preserve' to use the original column headers as table variable names.

3 - Read the RPW-TDS duty cycle data if correct mode is used (non nans)

```
numdays = length(CNN_ddc); % days with data
% Loop over all days
j = 1;
for i = 1:numdays
    number = CNN_ddc(i); % daily dust count (DDC) number
    if ~isnan(number)
        % if DDC is not nan, assign the duty cycle value
        dcycle(i) = fit_data.dutyCycle_day_(j);
        j = j + 1;
    else
        % if DDC is nan, assign nan to duty cycle value
        dcycle(i) = nan;
    end
end
```

4 - Convert from daily dust count to dust impact rates using duty cycle values

```
% Calculate medain of duty cycle values
dcm = median(dcycle(~isnan(dcycle)));
% Loop over all days
id = 1;
for i = 1:numdays
             dc = dcycle(i);
              % Ignore days without duty cycle values
              if isnan(dc)
                           continue
              end
              % Ignore days without dust count values
              if isnan(CNN data.daily dust count(i))
                           continue
              else
                           % Only consider days where the duty cycle is within 10 % of the median
                           if dc < dcm*0.9 || dc < dcm*1.1
                                         % Convert day to datetime format
                                         day_str = cell2mat(CNN_data.days(i));
                                         \label{eq:day_str(1:4),'-',day_str(6:7),'-',day_str(9:10)]} \\ \text{day_datetime(id)} = \text{datetime([day_str(1:4),'-',day_str(6:7),'-',day_str(9:10)])}; \\ \text{day_datetime(id)} = \text{datetime([day_str(1:4),'-',day_str(9:10),'-',day_str(9:10)])}; \\ \text{day_datetime(id)} = \text{datetime([day_str(1:4),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',day_str(9:10),'-',da
                                         % Convert from daily dust count to dust impact rates using duty cycle values
                                         TDS day(:,id) = TDS_data.daily_dust_count(i)/dc;
                                         SVM_day(:,id) = SVM_data.daily_dust_count(i)/dc;
                                         CNN_day(:,id) = CNN_data.daily_dust_count(i)/dc;
                                         id = id +1;
                           else
                                          % If duty cycke is not within 10 %, continue
                           end
              end
end
```

5 - Mark days at aphelion and perihelion

```
% Aphelion days: 10-Feb-2021 12-Sep-2021
aphelion1 = cell2mat(CNN_data.days(241));
aphelion2 = cell2mat(CNN_data.days(455));

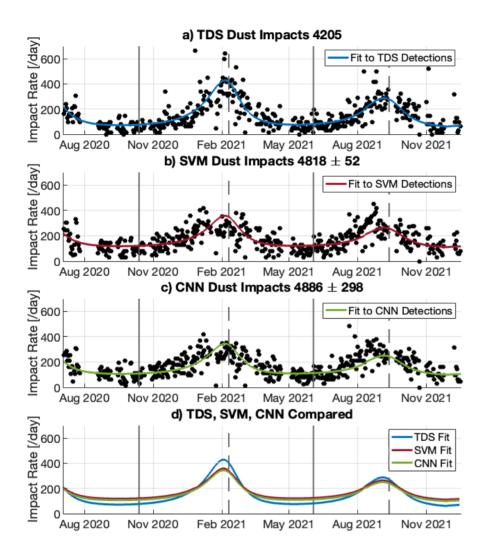

% Perihelion days: 13-Oct-2020 03-Jun-2021
perihelion1 = cell2mat(CNN_data.days(121));
perihelion2 = cell2mat(CNN_data.days(354));

% Convert to datetime format
aphelion = [datetime([aphelion1(1:4),'-',aphelion1(6:7),'-',aphelion1(9:10)]), ...
    datetime([aphelion2(1:4),'-',aphelion2(6:7),'-',aphelion2(9:10)])];
perihelion = [datetime([perihelion1(1:4),'-',perihelion1(6:7),'-',perihelion1(9:10)]);
    datetime([perihelion2(1:4),'-',perihelion2(6:7),'-',perihelion2(9:10)])];
```

6 - Plot the dust impact rates and the fit to the data

```
% Define figure properities
FIG = figure('units', 'centimeters', 'position',[1,1,24.0,36.0]);
sx = 0.07;
sy = 0.08;
fz = 14;
mkz = 50;
mz = 5;
lw = 3;
lwr = 2;
ystart = 0;
ystop = 700;
```

```
% Plot TDS dust detction rates and fit
